Challenge: Return a Model to the Hello View

Similar to how we made the Index view accepts and displays a Model passed by the Index Action in our HelloWorldController, Change the Hello View to accept a new Dog object and display its data.
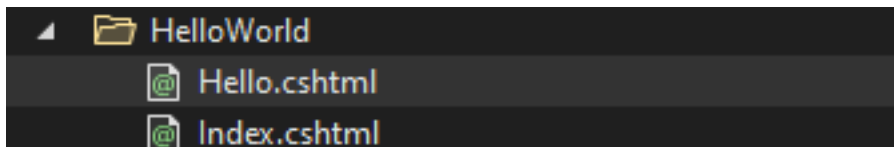

Solution :

1. In our HelloWorldController.

Create a new DogViewModel Object and pass it to our View.

```
public IActionResult Hello()
{
    DogViewModel doggo = new DogViewModel() { Name = "Shibimaru", Age =
5 };

    return View(doggo);

}
```

2. Now in our Hello View:

Set the @model type to be our DogViewModel class.

```
@model FirstMVCApp.Models.DogViewModel
<h1 >I have evolved!.</h1>
```

3. Use the @Model property to access the object data.

```
@model FirstMVCApp.Models.DogViewModel
<h1 >I have evolved!.</h1>

<h4>A dog named @Model.Name says hello</h4>
<h4>@Model.Name is @Model.Age years old </h4>
```

Now run the app and access the Hello Action of the HelloWorldController.
